

Product Bulletin: "Weather Protection" upgrade

Product Description: Guardian Impax Security Boards "Pressure Laminated"

Guardian Building Products (Qld) has always been heavily committed to product research and development of both products and systems produced by our organisation. In keeping with this philosophy, we have recently completed a four month trial to establish a "weather protection" enhancement to Guardian Impax Security Board.

Whilst confident that the performance of the product will consistently meet the needs of the market, we have been made aware that once leaving our factory complex bound for distant destinations on contract carriers, that handling and transportation methods adopted are no longer within our control.

As a result of these concerns, Guardian has set out to provide a safety net for customers of this product range, which whilst not considered bullet-proof, will certainly provide a far greater assurance that the product purchased will in fact reach your site in prime condition.

Our handling and storage specifications have not altered and should be followed at all times from point of manufacture through to site installation. What we have achieved is a process, that should the product get wet during the transportation and or site loading process, which will provide considerable protection and preservation to the product prior to installation.

Guardian Impax Security Board in single sided configuration now boasts an industry first in providing in-built weather protection to the product throughout it's journey to site installation. All future product will be branded "*wp*" to identify to users that they are indeed receiving the additional benefit.

Guardian will continue it's investigation into further developments to ensure that customers of Guardian Impax Boards have access to the very best in intruder resistant security panel products.
